Reliable Controls Releases RC-Toolkit™ 3

Victoria, BC, Canada – Reliable Controls is pleased to announce the release of RC-Toolkit™ 3, which introduces a number of new features in order to save time and improve productivity.

Capabilities included with this release:
- New Access menu containing services such as Panel File Utility, Modbus Profile Creator, Connect/Disconnect, and Exit.
- New Options menu for BACnet® and Communication Preferences.
- New System Tree allowing the discovery of networks and controllers in a system.
- New persistent Tool Selector that allows tool switching without disconnecting.
- New OpenADR Setup tool allows configuring your MACH-System for Automated Demand Response.
- New Addition of Bugsplat crash reporting service improves the software quality.
- New improvements to performance, the user interface, and licensing options.

This major upgrade is essential to help technicians integrate, expand, and commission the Reliable Controls MACH-System®.

RC-Toolkit 3 improves the experience for dealers and end users. The new GUI is consistent with other version 3 software previously released by Reliable Controls, which improves intuitiveness and provides a more efficient navigation experience.

This release also includes Modbus setup improvements, allowing for configuration of new override properties for slave devices, displays of new diagnostic properties, and a new Modbus Parameter test feature.
