Reliable Controls Releases RC-WebView® 3.8

Victoria, BC, Canada – RC-WebView 3.8 from Reliable Controls is a browser-based, enterprise solution that meets or exceeds the BACnet® Operator Workstation profile (B-OWS), allowing operators and administrators to manage any BACnet, Internet-connected building configured with RC-Studio properties. RC-WebView's strength lies in its ability to connect multiple, independent control systems into a single Enterprise Website, accessed by a Single-Sign-On (SSO).

New features and improvements include:

- After Hours Services allows tenants to request and building managers to approve equipment operation outside of regularly scheduled periods. A report feature summarizes after hours activity and associated costs.

- Improved object selection interface allows users to quickly scroll through object lists or filter objects on keyword selection.
- Enhanced Permissions service for Enterprise Schedules allows administrators to restrict access to selected schedules.
- Improved and optimized overall performance.

Designed to take full advantage of the latest web technologies and mobile platforms, RC-WebView is the ideal web solution for today's progressive facility manager.
